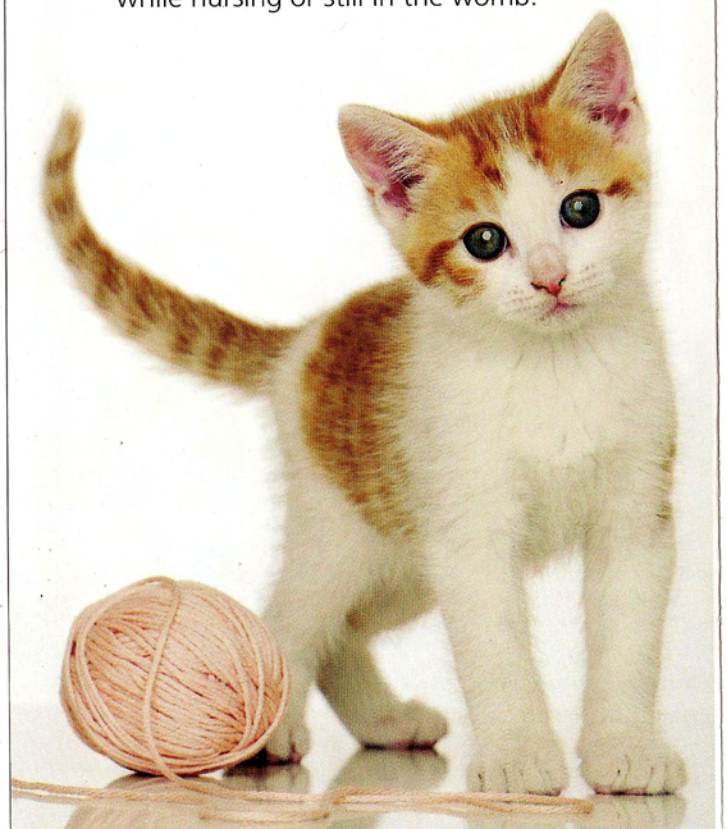
a serious **threat.**

When is your cat at risk?

All it takes to spread feline leukemia is contact with the bodily fluid of an infected animal. Any of these situations could put your cat or kitten at risk:

- Social grooming
- Common litter boxes
- Shared food and water bowls
- Bite wounds

The virus is especially dangerous to young cats.[3] Kittens can contract the disease from their mothers while nursing or still in the womb.[3]



Powerful delivery. Pure potency.

Together, PUREVAX Recombinant Leukemia vaccine and the VET JET transdermal vaccination system offer the protection your cat needs — without the use of adjuvants or needles.

If you have any questions about vaccination against feline leukemia virus, ask your veterinarian.

Feline Leukemia:

Kittens can't fight it alone.

Is your cat protected?

PUREVAX® Purity. Potency. Peace of Mind. vet jet™

Protect your cat from a serious ***threat.***

Feline leukemia is one of the most important causes of illness and death among cats.[1] It causes cancer in about 20% of infected cats[2] and also contributes to other infectious diseases (such as anemia) by suppressing the immune system and bone marrow production.[3] A major source of spreading the disease is persistently infected cats that appear to be healthy.[2]

Fortunately, there's something you can do. A simple vaccination is the best way to help protect your cat against the feline leukemia virus.

Advanced Protection.

Your veterinarian is committed to helping you make the best choices for your cat's health. To give your cat the protection it needs, this clinic recommends vaccination with PUREVAX® Recombinant Leukemia vaccine.

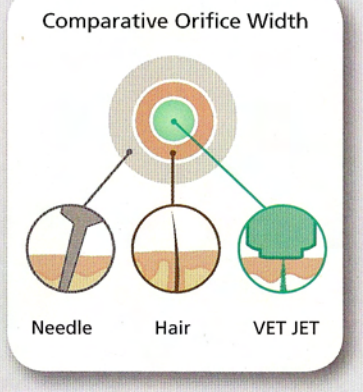
It's proven highly effective against the feline leukemia virus.[4] PUREVAX Recombinant Leukemia vaccine also protects without the need for adjuvants, chemical additives that may present potential risks to feline patients, such as injection site reactions and chronic inflammation.[5,6] Chronic inflammation has been associated with the development of cancer in some cats.[7,8]

Advanced Delivery.

PUREVAX Recombinant Leukemia vaccine is administered with the VET JET™ transdermal vaccination system. The VET JET system delivers the protection your cat needs without needles.

It delivers a low-volume dose in less than a second — directly depositing the vaccine into the skin and underlying tissue, allowing the vaccine to be quickly distributed among the many cells located in the layers under the skin.

It's the same technology that has been used for decades in administering insulin to people with diabetes.



No needles required. The VET JET transdermal vaccination system delivers a low-volume dose of vaccine through a tiny opening — about the diameter of a human hair.
