

FELINE VACCINATION PROTOCOLS

Panleukopenia (feline distemper)

1. Felines begin at 6 weeks of age or earliest possible after that
2. Booster dose every 3 weeks to minimum of 16 weeks of age
3. Booster dose 1 year later.
4. Thereafter, boost every 3rd year

Rhinotracheitis, Calici, Chlamydia (feline upper respiratory viruses)

1. Felines begin at 6 weeks of age or earliest possible after that
2. Booster dose every 3 weeks to minimum of 16 weeks of age
3. Booster dose yearly

Rabies

1. Felines at 3 months of age or soonest possible afterwards
2. Booster dose 1 year later
3. Booster dose every 3rd year
4. If exposure to vector animal, get booster ASAP, then restart 3 year count
5. May not administer within 10 days of a human bite incident

FeLV (feline leukemia virus)

1. All felines new to a household should be screened for this deadly disease as soon as possible, and before exposure to other felines in the house
2. At-risk felines begin vaccination at 12 weeks of age or earliest possible thereafter
3. Booster dose 3 weeks later
4. Booster dose yearly

FIP (feline infectious peritonitis)

1. No reliable screening test
2. We don't recommend this vaccine at this time

FIV (feline immunodeficiency virus)

1. All felines new to a household should be screened for this disease as soon as possible, and before exposure to other felines in the house
2. We don't recommend the vaccine at this time
